p-Akt (S473): cell exclusions and artifact-pixel removal

09082026 · Well 1 · five ROIs per condition · final reviewed rules and historical spread masks

Full observed ranges in both panels. The y-axis scales differ; the cell populations also differ.

Before · 13,542 identified neurons

After · 7,440 retained neurons

Dots: individual neurons, colored by ROI. White dot: median; dark bar: IQR. No cell subsampling or intensity trimming.

Hot pixels (I ≥ 5) and adopted spread pixels leave both the intensity sum and pixel-count denominator. No background subtraction.
